

Titanium Dioxide is Banned as a Food Additive in Bahrain

food-safety, ingredients

Richards 1 June 21, 2024, 9:00pm

Titanium dioxide (E171) is a widely used substance that has been utilized in various industries, including food, cosmetics, and pharmaceuticals. It is a white pigment that is added to food products to make them look more appealing and visually attractive. However, recent studies have shown that titanium dioxide can have harmful effects on human health, leading to its ban as a food additive in several countries.

Researchers look to ‘brilliant whiteness’ in shrimp stripes to find E171...

A new material discovered in the Pacific Cleaner Shrimp could inspire the development of new whitening materials in foods as a replacement for titanium dioxide (E171), say scientists.
